

# Accelerating the adoption of Circular Economy in the Offshore Wind Industry: lessons for Norway

Pankaj Ravindra Gode

Havvind og miljøseminar  
November, 5<sup>th</sup> 2024

# A brief look at the offshore wind industry

How current turbines stack up

Offshore wind turbines\*

© FT

- Offshore wind is born-global industry
- 75 GW total capacity in operation by 2023. Overall deployment can reach 487 GW by 2033
- Massive growth in wind turbine sizes
- Large scale decommissioning in next 5-10 years
- CE is looked as a promising alternative to sustainably manage the resources

# Offshore wind development in Norway

**6 December 2022**  
Tender criteria release for Utsira Nord & Sørlige Nordsjø II with recycling clause at EOL

**25 April 2023**  
The Norwegian Water Resources and Energy Directorate (NVE) identified 20 new potential areas

**11 May 2022**  
30 GW offshore wind development by 2040

**29 March 2023**  
Norway opened Utsira Nord & Sørlige Nordsjø II for auctioning

**17 June 2024**  
35 billion nok state budget allocated for Vestavind B and Vestavind F

# Background

## Waste treatment hierarchy

Keep parts for longer.  
Design for easier dismantling and recycling.  
Minimise number of materials in design manufacture.

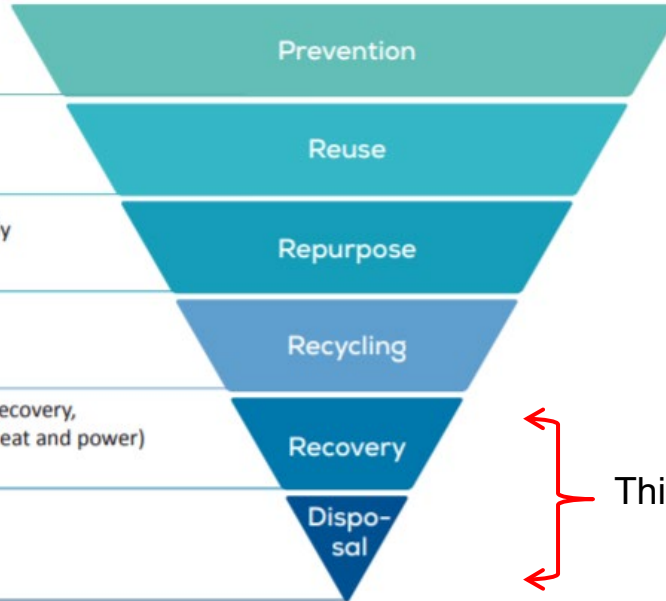

Check, clean, repair, refurbish, repair whole items  
or spare parts.

Re-use an existing part for a different application, usually  
of lower value than the original.

Convert waste into a new substance or product.  
Includes composting if it meets protocols.

Includes anaerobic digestion, incineration with energy recovery,  
gasification and pyrolysis which produce energy (fuels, heat and power)  
and materials from waste.

Landfill and incineration without energy recovery.

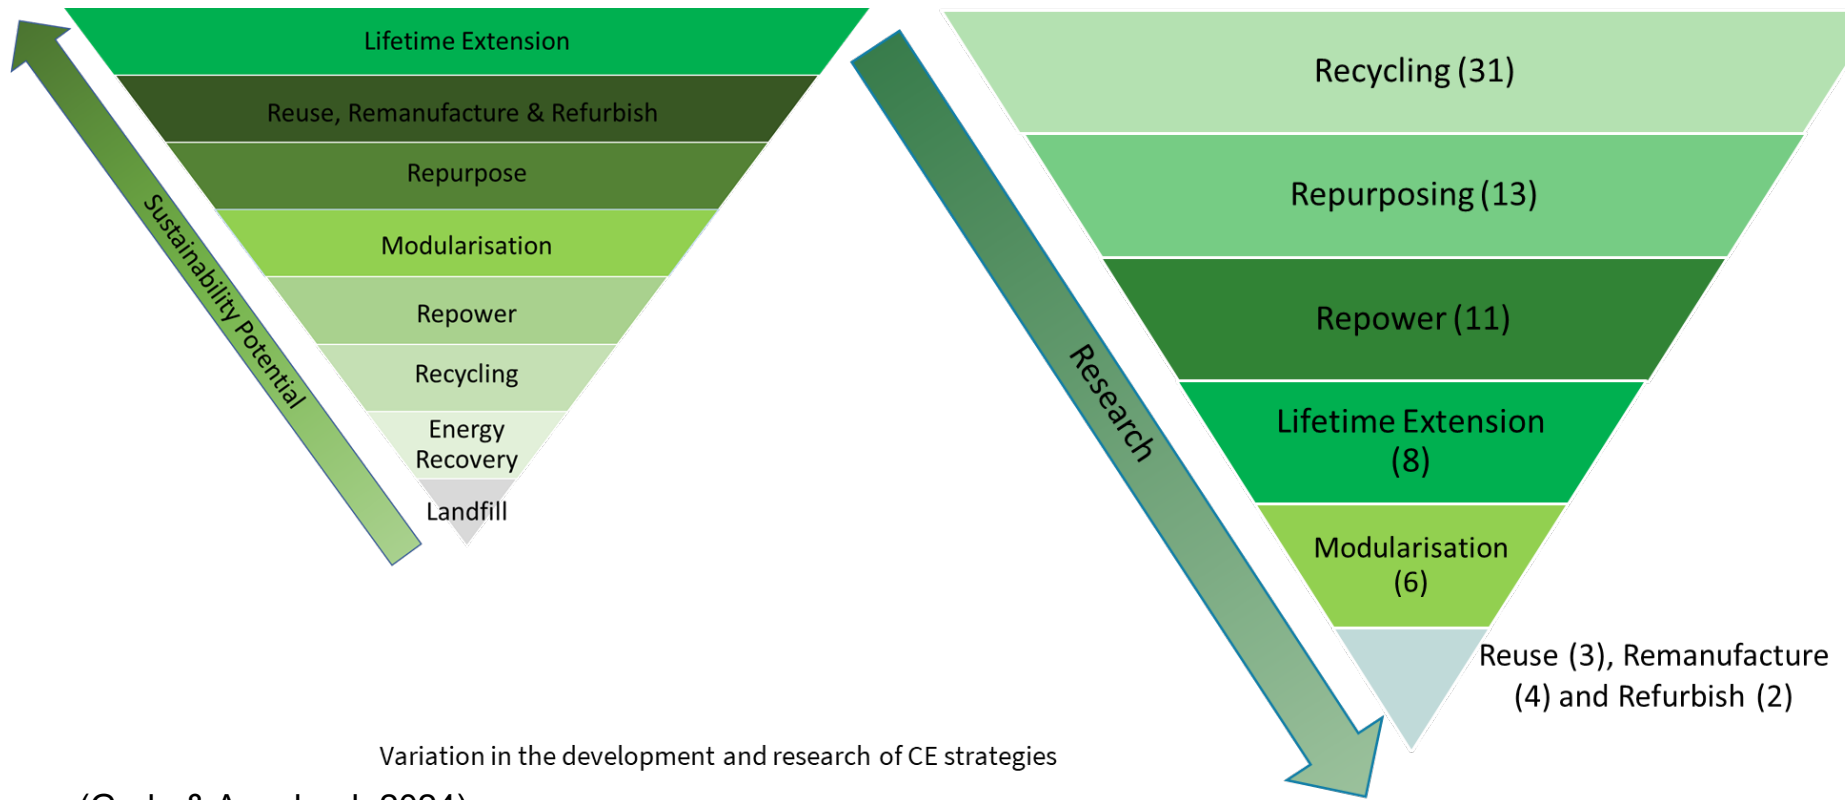

This is where we need to move. The higher, the better!

This is where we are

Waste management hierarchy for wind farm components  
(ETIPWind, 2020)

# Heterogeneity in the development of CE strategies

Variation in the development and research of CE strategies

(Gode & Aspelund, 2024)

# State of CE adoption in the offshore wind industry

- Practical problem: limited adoption of CE in the offshore wind industry
- Denmark, Germany, and the UK are global leaders in offshore wind deployment, however, struggling to find sustainable EOL solution
- Commercialization has just started in Norway
- **Opportunity: derive lessons and become a frontrunner in adopting CE**

# Data collection – empirical evidence

- Data sources: document analysis and semi-structured interviews with value chain actors
- Actor profiles of interest:
  1. Raw material suppliers - 1
  2. Original equipment manufacturers (OEMs) - 3
  3. Wind farm owners/operators - 3
  4. Decommissioning operators - 2
  5. CE business operators - 5
  6. Regulatory agencies/policymakers - 2
  7. Research centers and universities -5

(Jensen & Skelton, 2018)

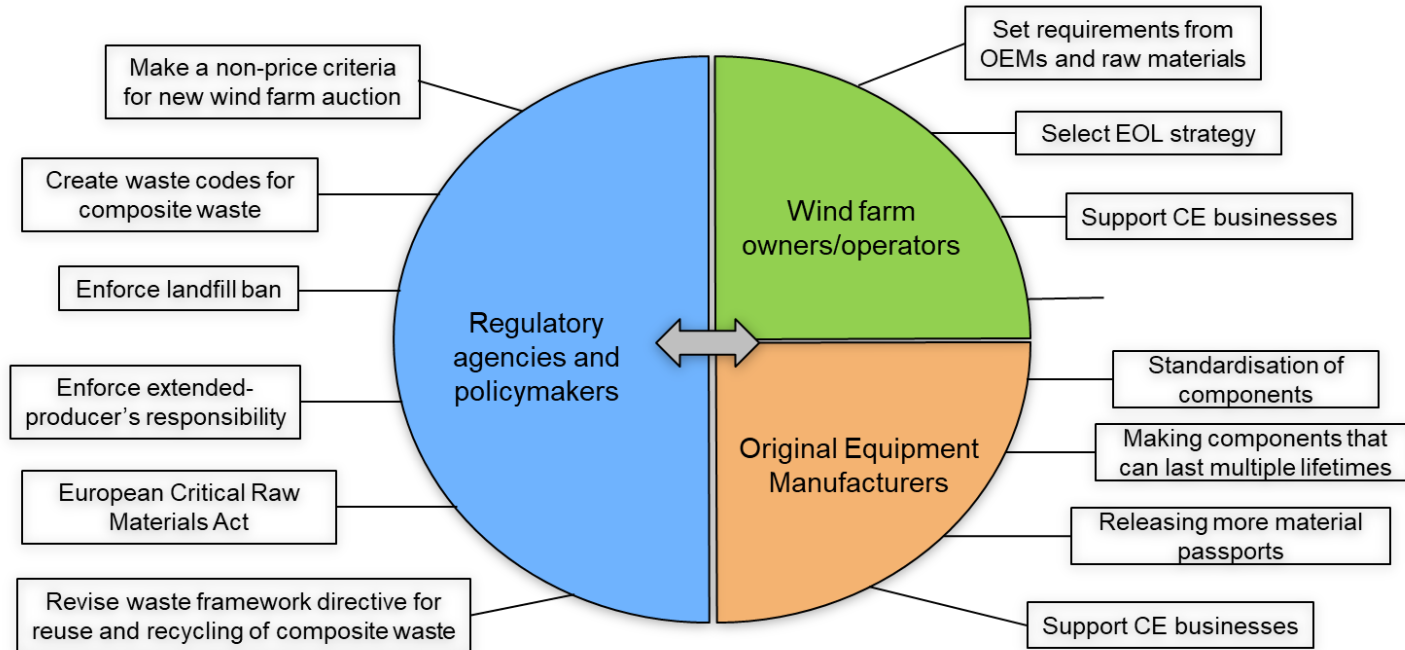

# Reasons for limited adoption of CE

- Value of CE comes late in product lifetime
- No one silver bullet
- Heterogenously developed CE strategies
- Recycling is the most developed and discussed CE strategy
- Business case is affected by scaling, environmental unceartainty and regulatory hurdles
- Lack of standardisation in the value chain
- Circularity discussion is centred around wind turbine blades

# Accelerating adoption of CE

- To push for more circularity in the industry someone in the value chain has to play a central role. But who?

# How to become a frontrunner?

1. Advanced planning:
  - Designing components and related EOL strategies
  - Defining responsibilities early in the planning stage
  - Setting a non-price criteria: higher order CE strategies when you can, recycling when you must
2. Local solutions:
  - Incentivizing local circular strategies
  - Avoid transboundary export of waste
3. Collaboration & innovation:
  - Engage all relevant value chain stakeholders
  - Foster innovation in materials and processes

# Thank you!
