

Enabling industry and nature to coexist

Birds and offshore wind:
Bridging data gaps with AI-powered solutions

Havvind og miljøseminar 2024 - Ask Helseth CEO

Agenda

Addressing critical bird data gaps

- Barrier effects
- Displacement and habitat loss
- Collision risks

The ripple effects on project timelines and costs: risks

- Delays
- Project limitations
- Costly and inefficient mitigation measures

Tech to enable proactive bird data collection

- Continues monitoring in operations
- Pre construction monitoring using LIDAR buoy

METCentre case study

- Data collected at METCentre
- Results from two years on monitoring

Offshore Wind in Europe: Addressing critical bird data gaps

Kittiwake: 60% population loss since 1986 (UK)

Band Model: Example of avoidance rates

Species	Recommended avoidance rate	Rationale/supporting evidence
Red-throated diver	99.5%	Furness (2015)
Black-throated diver	99.5%	Breeding birds show similar behaviour to red-throated diver; Furness (2015)
Swans (all species)	99.5%	Increased from previous rate of 98% based on evidence presented in Whitfield & Urquhart (2015), but slightly more precautionary than report recommendation given this was based on a short run of data from one study
Geese (all species)	99.8%	SNH (2013)
Red kite	99%	Urquhart & Whitfield (2016)
Hen harrier	99%	Whitfield & Madders (2006a)
Golden eagle	99%	Whitfield (2009)
White-tailed eagle	95%	Sufficient evidence from flight behaviour and collision monitoring studies in Norway for vulnerability to collisions; see May <i>et al.</i> (2011)
Kestrel	95%	Sufficient evidence from flight behaviour (including hovering) and collision monitoring studies for vulnerability to collisions; see Whitfield & Madders (2006b)
Great skua	99.5%	Furness (2015)
Arctic skua	99.5%	Similar behaviour of breeding birds to great skua; Furness (2015)

Traditional monitoring methods

Data uncertainty: The ripple effects on project timelines and costs

RWE lawyer 'shocked' at UK planning delay to \$9bn Dogger Bank South wind farm over seabirds

Solicitor claims 'you're making a mistake' as opening of examination is delayed on 3GW North Sea project

Birds such as kittiwakes have been an issue for UK offshore wind developers. (Photo: Tom Lee via Flickr/<https://creativecommons.org/licenses/by-nd/2.0/>)

Andrew Lee

A lawyer for RWE said he was "shocked" and accused planning officials of "making a mistake" after the consenting process for one of the world's largest planned offshore wind farms was delayed over an issue all too familiar to the UK sector – seabirds.

EU: Focus on biodiversity and development speed

Norway's early advantage: Proactive bird data collection

Continuous Bird Monitoring With Spoor's Camera- and AI-Based System at the TetraSpar Demonstrator Floating Wind Turbine

Post-installation monitoring report
January 2022 - June 2024

6 August 2024

AI in action: METCentre results

Permit compliance with extra insights from postconstruction monitoring

Timeline

TetraSpar commissioned
27 June – 9 November 2021

6 months :

June – December 2021

20 months :

January 2022 – February 2023

October 2023 – June 2024

- 5,487 hours of recording
- Sunrise to sunset

Data outputs

Families and species; seasonal variation;
diversity peaks during migration

- 91% gulls
- 40% Great black-backed gull

Abundance estimations; seasonal
variation; peaks during migration

Flying heights; peak 35-55 m

Dominant flight directions

Wind correlation; 12+ m/s = few birds

Zero collision detections

Technical specs

One 8K camera

Data 20 TB collected; local storage
buffer and fiber connection

All empirical evidence is retained, from
video recordings to raw data

Marine grade systems

Sørlige Nordsjø II: First-of-its-kind bird data being collected
